# 1 Data editing

## 1.1 character set

### 1.1.1 Input Character Set

In order for the reading module to know the correct character set of the code, it can be set by reading the "Input Character Set".

\*Automatic

GBK

UTF8

ASCII

Shift-JIS Japanese

### 1.1.2 output character set

To match the host's character set, you can read the "Output Character Set" to set it.

\*Original format

GBK

UTF8

## 1.2 Barcode ID

### 1.2.1 AIM ID

AIM is the abbreviation of Automatic Identification Manufacturers (AIM), AIM ID defines the identification code for each standard barcode (AIM ID cannot be customized by the user), the specific definition is shown in [Appendix C](#) AIM ID list. The scanning module can add this identification code in front of the barcode data after decoding, the format is: "]" + letter "C" + number "0", for example, the AIM ID of CODE128 is "]" + letter "C" + number "0", for example, the AIM ID of CODE128 is "]" + letter "C" + number "0". ID for CODE128 is "]C0". Users can identify

different barcode types by AIM ID.

\* Disable

enable

### 1.2.2 CODE ID

The user can identify the different barcode types by CODE ID, which uses a single character for identification. For specific definitions, see [Appendix B : List of CODE IDs](#)

\* Disable

enable

### 1.3 closing character

In order to allow the host to quickly distinguish the current decoding results, you can turn on the add terminator function, and the read module will add the corresponding terminator after decoding the data.

Disable

carriage return

\* ↴ Enter

TAB

Carriage return. Carriage return.

### 1.4 prefix (linguistics)

#### 1.4.1 prefix switch

Prefix is a user-defined string of characters that can be modified before decoding the

message. Prefix can be added by scanning the "Enable" setting code, and cancellation of prefix can be realized by scanning "Disable".

\* Disable

enable

#### 1.4.2 Prefix content settings

Prefix setting can be used in two ways, method one requires user generated QR code, which tends to be more flexible to use for those who have more settings; method two can be used by scanning the setting code within this manual according to the steps.

##### Method I:

Add prefix setting code content format: >!010800XX. where XX is the setting variable, XX using hexadecimal representation, two characters as a unit, the lack of 0 to make up, can be arbitrarily superimposed, the maximum support for 10-bit data prefix.

For example, if you need to set the prefix character A, look up [Appendix E](#) character comparison table, hexadecimal is 41, then set the code content is: >!01080041.

For example, if you need to set the prefix character A B C, look up [Appendix E](#) Character comparison table, hexadecimal were 41 42 43, then set the code content is: >!010800414243.

##### Method II:

- Scanning the "Prefix Setting" Setting Code

Prefix Setting

- Scan the "[Digital Setting Code](#)", every two as a group.

For example, if you need to set the prefix character A, look up [Appendix E](#) Character comparison table, hexadecimal is 41, then sweep 4 and 1, respectively.

For example, if you need to set the prefix character ABC, look up [Appendix E](#) Character cross-reference table, hexadecimal 414243, then sweep 4, 1, 4, 2, 4, 3 respectively

- Scan the "OK" setup code to end the setup.

recognize

## 1.5 suffix (linguistics)

### 1.5.1 suffix switch

Suffix is a user-defined string that is modified after decoding the message. Suffix can be added by scanning the "Enable" setting code, and cancelled by scanning the "Disable" setting code.

\* Disable

enable

### 1.5.2 Suffix Content Setting

Suffix settings can be used in two ways, method one requires the user to generate a QR code, which tends to be more flexible for users who set up more settings; method two can be used according to the steps of scanning the setup code within this manual

#### Method I:

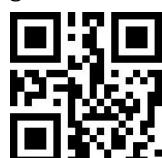

Add suffix setting code content format: >!010801XX. where XX is the setting variable, XX using hexadecimal representation, two characters as a unit, the lack of 0 to make up, can be arbitrarily superimposed, the maximum support for 10-bit suffix.

For example, if you need to set the suffix character A, look up [Appendix E](#) Character comparison table, hexadecimal is 41, then set the code content is: >!01080141.

For example, if you need to set the suffix character ABC, look up [Appendix E](#) Character comparison table, hexadecimal is 414243, then set the code content is: >!010801414243.

#### Method II:

- a) Scanning the "Suffix Setting" Setting Code

## Suffix Setting

- b) Scan the "[Digital Setting Code](#)", every two as a group.

For example, if you need to set the suffix character A, look up [Appendix E](#) Character comparison table, hexadecimal is 41, then sweep 4 and 1 respectively.

For example, if you need to set the suffix character ABC, look up [Appendix E](#) Character cross-reference table, hexadecimal 414243, then sweep 4, 1, 4, 2, 4, 3

- c) Scan the "OK" setup code to end the setup.

recognize

## 1.6 Add prefixes based on barcode type

### 1.6.1 Add prefix switches based on barcode type

Prefix is a user-defined string of characters that can be modified before decoding the message. Prefix can be added by scanning the "Enable" setting code, and cancellation of prefix can be realized by scanning "Disable".

\* Disable

enable (sb. to do sth)

### 1.6.2 Add prefix content settings based on barcode type

Prefix content settings can be used in two ways, method one requires user-generated QR codes, which tends to favor users who set up more settings and are more flexible in their use; method two can be used by scanning the setup codes within this manual according to the steps.

#### Method I:

According to the barcode type add prefix setup code content format: >!010806XXXX. Where XXXX is the setup variable, the first two XX indicates the barcode type, the relevant hexadecimal value can be according to the [Appendix F](#) XX use hexadecimal representation, two characters as a

unit, the lack of 0 to make up, can be arbitrarily superimposed, the maximum support for 10-bit data prefix.

For example, if you need to set the CODE128 barcode prefix character A, according to [Appendix F](#) the hexadecimal value of CODE128 is 01, according to the appendix F, check [Appendix E](#) Character comparison table, character A hexadecimal is 41, then set the code content as: >!0108060141.

For example: you need to set the CODE128 barcode prefix character A B C, according to the [Appendix F](#) the hexadecimal value of CODE128 is 01, according to Appendix F. [Appendix E](#) Character comparison table, the characters A B C hexadecimal were 41 42 43, then set the code content for: >!01080601414243.

#### Method II:

- a) Scanning the "Prefix Setting" Setting Code

Prefix Setting

- b) To set the barcode type, scan the "[Digital Setting Code](#)", every two as a group.

For example, if you need to set a prefix for CODE128, according to the [Appendix F](#) Barcode type check, CODE128 barcode type hexadecimal value is 01, then sweep 0 and 1, respectively.

- c) To set the prefix content, scan in order "[Digital Setting Code](#)", every two as a group.

For example, if you need to set the prefix character A, look up [Appendix E](#) character comparison table, the character A hexadecimal is 41, then sweep 4 and 1 respectively.

- d) Scan the "OK" setup code to end setup

recognize

#### 1.6.3 Clear prefixes based on barcode type

Clear the prefixes that have been set. There are two methods that can be used to clear the

prefix, method 1 requires the user to generate a QR code, which tends to favor users with more settings and is more flexible to use, and method 2 can be done by scanning the setup code within this manual according to the steps.

### Method I:

According to the barcode type to clear the prefix setting code content format is: >!010808XX, where XX is the setting variable, XX indicates that the barcode type using hexadecimal, two characters for a unit, the shortage of 0 to make up. The related hexadecimal value can be set according to [Appendix F](#) The related hexadecimal value can be found according to Appendix F.

For example, if you need to clear the CODE128 barcode prefix, according to the [Appendix F](#) According to Appendix F, the hexadecimal value of CODE128 is 01, then the setting code is: >!01080801.

### Method II:

- a) Scanning the "Clear Prefix" Setting Code

Clear prefix

- b) To clear the barcode type, scan in order "[Digital Setting Code](#)", every two as a group.

For example, if you need to clear the CODE128 prefix, according to the [Appendix F](#) Barcode type check, CODE128 barcode type hexadecimal value is 01, then sweep 0 and 1 respectively.

- c) Scan the "OK" setup code to end the setup.

recognize

## 1.7 Add suffixes based on barcode type

### 1.7.1 Add suffix switch based on barcode type

Suffix is a user-defined string that is modified after decoding the message. Suffix can be added by scanning the "Enable" setting code, and cancelled by scanning the "Disable" setting

code.

\* Disable

enable

### 1.7.2 Add suffix content settings based on barcode type

Suffix content setting can be used in two ways, method one requires user generated QR code, which tends to be more flexible to use for those who have more settings; method two can be used by scanning the setting code within this manual according to the steps.

#### Method I:

According to the barcode type add suffix setup code content format is: >!010807XXXX.

Where XXXX is the setup variable, the first two XX indicates the barcode type, the related hexadecimal value can be according to the [Appendix F](#) XXXX is the setting variable, the first two XX indicates the barcode type, the related hexadecimal value can be found according to Appendix F, the latter XX is expressed in hexadecimal, two characters are a unit, the insufficient one is made up with 0, and it can be stacked arbitrarily, and it can support up to 10 bit data suffix.

For example, if you need to set the CODE128 barcode suffix character A, according to [Appendix F](#) the hexadecimal value of CODE128 is 01, according to the appendix F, check [Appendix E](#) Character comparison table, character A hexadecimal is 41, then set the code content as: >!0108070141.

For example, if you need to set CODE128 barcode suffix character A B C, according to [Appendix F](#) the hexadecimal value of CODE128 is 01, according to Appendix F. [Appendix E](#) Character comparison table, character A B C hexadecimal were 41 42 43, then set the code content for: >!01080701414243.

#### Method II:

- Scanning the "Suffix Setting" Setting Code

Suffix Setting

- b) To set the barcode type, scan the "[Digital Setting Code](#)", every two as a group.

For example, if you need to set a suffix for CODE128, according to the [Appendix F](#) Barcode type check, CODE128 barcode type hexadecimal value is 01, then sweep 0 and 1 respectively

- c) To set the suffix content, scan in turn the "[Digital Setting Code](#)", every two as a group.

For example, if you need to set the suffix character A, look up [Appendix E](#) character comparison table, the character A hexadecimal is 41, then sweep 4 and 1 respectively.

- d) Scan the "OK" setup code to end setup

recognize

### 1.7.3 Clear suffixes based on barcode type

Clear the suffixes that have been set. There are two methods that can be used to clear the suffix, method 1 requires the user to generate a QR code, which tends to favor users with more settings and is more flexible to use, and method 2 can be done by scanning the setup code within this manual according to the steps.

#### Method I:

According to the barcode type to clear the suffix setting code content format: >!010809XX, where XX for the setting variable, XX that the barcode type using hexadecimal, two characters for a unit, the lack of 0 to make up. The related hexadecimal value can be set according to [Appendix E](#) The related hexadecimal value can be found according to Appendix F.

For example, if you need to clear the CODE128 barcode suffix, according to the [Appendix F](#) According to Appendix F, the hexadecimal value of CODE128 is 01, then the setting code is: >!01080901.

#### Method II:

- a) Scanning the "Remove Suffix" Setting Code

remove suffix

- b) To clear the barcode type, scan in order "[Digital Setting Code](#)", every two as a group.

For example, if you need to clear the CODE128 suffix, according to the [Appendix F](#) Barcode type check, CODE128 barcode type hexadecimal value is 01, then sweep 0 and 1 respectively.

- c) Scan the "OK" setup code to end setup

recognize

## 1.8 Hide fixed characters

This function can be used to hide strings that the user doesn't need to output according to the requirements.

### 1.8.1 Hide Fixed Character Switch

\* Disable

enable

### 1.8.2 Hide fixed character settings

Hidden fixed character settings can be used in two ways, method one requires the user to generate a QR code, which tends to set up more users, the use of more flexible; method two can be scanned according to the steps of the setup code in this manual

#### Method I:

Hidden Fixed Character Setting Code Content Format: >!010802XX. where XX is the setting variable, XX using hexadecimal representation, two characters as a unit, the lack of 0 to make up, can be arbitrarily superimposed, the maximum support for 20 bits.

For example, if you need to set the hidden character A, look up [Appendix E](#) Character Comparison Table, hexadecimal is 41, then set the code content is: >!01080241.

For example, if you need to set the hidden characters ABC, check the [Appendix E](#) Character comparison table, hexadecimal is 414243, then set the code content: >!010802414243.

**Method II:**

- a) Scanning the "Hide Fixed Characters" Setting Code

Hide fixed characters

- b) Scan the "[Digital Setting Code](#)", every two as a group.

For example, if you need to hide the character A, look up [Appendix E](#) Character cross-reference table, hexadecimal is 41, then sweep 4 and 1, respectively.

For example, if you need to hide line breaks, check the [Appendix E](#) Character comparison table, hexadecimal is 0A, then sweep 0 and A respectively

- c) Scan the "OK" setup code to end setup

recognize

## 1.9 Retention of barcode data based on length

This function allows you to retain the data required by the user in the barcode on demand.

### 1.9.1 Retain data switch

\* Disable

forward indexing

reverse index

[Note] Forward indexing (starting from the front end of the data); reverse indexing (starting from the back end of the data)

### 1.9.2 Preserve data start position

Starting setup can be done using two methods, method 1 requires user generated QR code, which tends to favor users with more setup and more flexible usage; method 2 can be done by scanning the setup code within this manual according to the steps.

**Method I:**

Start position setup code content format: >!00102AXX, where XX is the setup variable, decimal range 1-65535.

For example, if the start position is set to 11, the setup code will read: >!00102A11.

#### **Method II:**

- a) Scanning the "starting position" setup code

starting position

- b) Scan "[Number Setting Code](#)", start from the first digit and scan the corresponding number setting code. For example, for the 11th digit, scan 1,1; for the 100th digit, scan 1,0,0.
- c) Scan the "OK" setup code to end setup

recognize

#### **1.9.3 Preserve data end position**

Two methods can be used to end the setup, method 1 requires user generated QR code, which tends to favor users with more setups and more flexible usage; method 2 can be used by scanning the setup code within this manual according to the steps.

#### **Method I:**

End position setup code content format: >!00102BXX, where XX is the setup variable, decimal range 1-65535.

For example, if the end position is set to 50, the setup code will read: >!00102B50.

#### **Method II:**

- a) Scanning the "end position" setup code

end position

- b) Scan "Number Setting Code", from the end of the first digit, scan the corresponding number setting code. For example, for the 50th digit, scan 5,0.
- c) Scan the "OK" setup code to end setup

recognize

## 1.10 Hide barcode data by length

This function allows you to hide data in the barcode that is not needed by the user on demand.

### 1.10.1 Hidden Barcode Data Switch

\* Disable

forward indexing

reverse index

[Note] Forward indexing (starting from the front end of the data); reverse indexing (starting from the back end of the data)

### 1.10.2 Hide barcode data start position

Starting setup can be done using two methods, method 1 requires user generated QR code, which tends to favor users with more setup and more flexible usage; method 2 can be done by scanning the setup code within this manual according to the steps.

#### Method I:

Start position setup code content format: >!001027XX, where XX is the setup variable, decimal range 1-65535.

For example, if the start position is set to 11, the setup code will read: >!00102711.

#### Method II:

- a) Scanning the "starting position" setup code

starting position

- b) Scan "Number Setting Code", start from the first digit and scan the corresponding number setting code. For example, for the 11th digit, scan 1,1; for the 100th digit, scan 1,0,0.
- c) Scan the "OK" setup code to end setup

recognize

### 1.10.3 Hide barcode data end position

Two methods can be used to end the setup, method 1 requires user generated QR code, which tends to favor users with more setups and more flexible usage; method 2 can be used by scanning the setup code within this manual according to the steps.

#### **Method I:**

End position setup code content format: >!001028XX. where XX is the setup variable, decimal range 1-65535.

For example, if the end position is set to 50, the setup code will read: >!00102850.

#### **Method II:**

- a) Scanning the "end position" setup code

end position

- b) Scan "Number Setting Code", end at the first digit and scan the corresponding number setting code. For example, for the 11th digit, scan 1,1; 100th position, sweep 1,0,0.
- c) Scan the "OK" setup code to end setup

recognize

## 1.11 Hide barcode data of any length according to barcode type

This function allows you to hide the data in the barcode that the user does not need according to the barcode type on demand.

### 1.11.1 Hide Barcode Data Switch by Barcode Type

\* Disable

forward indexing

reverse index

[Note] Forward indexing (starting from the front end of the data); reverse indexing (starting from the back end of the data)

### 1.11.2 Hide data start position by barcode type

Starting setup can be done using two methods, method 1 requires user generated QR code, which tends to favor users with more setup and more flexible usage; method 2 can be done by scanning the setup code within this manual according to the steps.

#### Method I:

According to the barcode type to hide the starting position of the data content format: >!01080AXXX. Where XXXX is the setting variable, the first two XX indicates the barcode type, the relevant hexadecimal value can be according to the [Appendix F](#) XXXX is the setting variable, the first two XX represent the barcode type, the relevant hexadecimal value can be found according to Appendix F, the latter XX is expressed in hexadecimal, two characters are a unit, the shortfall is made up with 0, and the length range is 0x0000-0xFFFF.

For example: you need to hide the CODE128 start position set to 11, according to the [Appendix F](#) we find that the hexadecimal value of CODE128 is 01, and the hexadecimal of 11 is 0B, then the content of the setting code is: >!01080A010B.

#### Method II:

- Scanning the "Barcode Type and Start Position" Setting Code

Barcode type and starting position

- b) To set the barcode type, scan in order "[Digital Setting Code](#)", every two as a group.

For example, if you need to hide CODE128, according to the [Appendix F](#) barcode type, CODE128 barcode type hexadecimal value is 01, then sweep 0 and 1, respectively.

- c) To set the starting position, scan in turn the "[Digital Setting Code](#)", every two as a group.

The use here refers to hexadecimal. For example, bit 11, hex 0B, sweeps 0, B; bit 100, hex 64, sweeps 6, 4.

- d) Scan the "OK" setup code to end setup

recognize

### 1.11.3 Hide data end position according to barcode type

Two methods can be used to end the setup, method 1 requires user generated QR code, which tends to favor users with more setups and more flexible usage; method 2 can be used by scanning the setup code within this manual according to the steps.

#### Method I:

According to the barcode type to hide the end position of the data content format is: >!01080BXXXX. where XXXX is the setting variable, the first two XX indicates the barcode type, the relevant hexadecimal value can be based on the [Appendix F](#) XXXX is the setting variable, the first two XX indicate the barcode type, the relevant hexadecimal value can be found according to Appendix F, the latter XX is expressed in hexadecimal, two characters are a unit, the shortfall is made up with 0, the length range is 0x0000-0xFFFF.

For example: you need to hide the CODE128 end position set to 100, according to the [Appendix F](#) we find that the hexadecimal value of CODE128 is 01 and the hexadecimal value of 100 is 64, then the content of the setting code is: >!01080B0164.

#### Method II:

- a) Scanning "Barcode Type and End Position" Setting Code

Barcode type and end position

- b) To set the barcode type, scan in order "[Digital Setting Code](#)", every two as a group.

For example, if you need to hide CODE128, according to the [Appendix F](#) barcode type, CODE128 barcode type hexadecimal value is 01, then sweep 0 and 1, respectively.

- c) To set the end position, scan in turn the "[Digital Setting Code](#)", every two as a group.

The use here refers to hexadecimal. For example, bit 11, hex 0B, sweeps 0, B; bit 100, hex 64, sweeps 6, 4.

- d) Scan the "OK" setup code to end setup

recognize

## 1.12 Hide any length of barcode header data by barcode type

This function can hide barcode data of any length that is not needed in the header according to the barcode type on demand.

### 1.12.1 Switch to hide any length of data in the barcode header according to barcode type

\* Disable

enable

### 1.12.2 Hide barcode header arbitrary length settings by barcode type

Two methods can be used for length setting, method 1 requires user generated QR code, which tends to favor users with more settings and is more flexible to use; method 2 can be used by scanning the setting code within this manual according to the steps.

### Method I:

The length format for hiding arbitrary length data in the barcode header according to the barcode type is: >!01080CXXXX. where **XXXX** is a setup variable, the first two **XXs** indicate the barcode type, and the related hexadecimal value can be set according to the [Appendix F](#) XXXX is the setting variable, the first two XX indicate the barcode type, the related hexadecimal value can be found according to Appendix F, the latter **XX** is expressed in hexadecimal, two characters are a unit, the shortfall is made up with 0, the length range is 0x0000-0xFFFF.

For example: the need to hide data of length 15 in the CODE128 header, according to the [Appendix F](#) we find that the hexadecimal value of CODE128 is 01, and the hexadecimal of 15 is 0F, then the content of the setup code is: >!01080C010F.

### Method II:

- a) Scanning "Barcode Type and Length" Setting Code

Barcode Type and Length

- b) To set the barcode type, scan in order "[Digital Setting Code](#)", every two as a group.

For example, if you need to hide CODE128, according to the [Appendix F](#) barcode type, CODE128 barcode type hexadecimal value is 01, then sweep 0 and 1, respectively.

- c) To set the length, scan in turn the "[Digital Setting Code](#)", every two as a group.

The use here refers to hexadecimal. For example, length 11, hex 0B, sweep 0, B; length 100, hex 64, sweep 6, 4.

- d) Scan the "OK" setup code to end setup

recognize

## 1.13 Hide any length of data at the end of the barcode according to the barcode type

This function allows you to hide barcode data of any length that is not needed at the end

according to the barcode type on demand.

### 1.13.1 Switch to hide any length of data at the end of the barcode according to the barcode type

\* Disable

\* Enable

enable

### 1.13.2 Hide barcode tail arbitrary length setting according to barcode type

Two methods can be used for length setting, method 1 requires user generated QR code, which tends to favor users with more settings and is more flexible to use; method 2 can be used by scanning the setting code within this manual according to the steps.

#### Method I:

The length format to hide any length data at the end of the barcode according to the barcode type is: >!01080DXXXX. where XXXX is a setting variable, the first two XXs indicate the barcode type, and the related hexadecimal value can be set according to the [Appendix F](#) XXXX is the setting variable, the first two XX indicate the barcode type, the related hexadecimal value can be found according to Appendix F, the latter XX is expressed in hexadecimal, two characters are a unit, the shortfall is made up with 0, the length range is 0x0000-0xFFFF.

For example: it is necessary to hide the data of length 12 in the tail of CODE128, according to the [Appendix F](#) Find that the hexadecimal value of CODE128 is 01, and the hexadecimal of 12 is 0C, then the content of the setup code is: >!01080D010C.

#### Method II:

- Scanning "Barcode Type and Length" Setting Code

Barcode Type and Length

- To set the barcode type, scan in order "[Digital Setting Code](#)", every two as a group.

For example, if you need to hide CODE128, according to the [Appendix F](#) barcode type,

CODE128 barcode type hexadecimal value is 01, then sweep 0 and 1, respectively.

- c) To set the length, scan in turn the "[Digital Setting Code](#)", every two as a group.

The use here refers to hexadecimal. For example, length 11, hex 0B, sweep 0, B; length 100, hex 64, sweep 6, 4.

- d) Scan the "OK" setup code to end setup

recognize

## 1.14 Inserting Custom Data

This function allows you to insert user-defined data at any position in the barcode data as required.

### 1.14.1 Insert Custom Data Switch

\* Disable

enable

### 1.14.2 Customized data

Customized data can be used in two ways, method one requires the user to generate a QR code, which tends to set up more users, the use of more flexible; method two can be based on the steps to scan the setup code within this manual

#### Method I:

Custom insert data setup code content format: >!010803XX. where XX is the setup variable, XX using hexadecimal representation, two characters as a unit, the lack of 0 to make up for, can be arbitrarily superimposed, the maximum support for 20 bits of custom data.

For example, if you need to insert custom data A, look up [Appendix E](#) Character comparison table, the hexadecimal is 41, then set the code content is: >!01080341.

For example, if you need to insert the custom data ABC, check the [Appendix E](#) Character comparison table, hexadecimal is 414243, then set the code content is: >!010803414243.

**Method II:**

- a) Scanning the "custom data" setup code

Customized data

- b) Scan the "[Digital Setting Code](#)", every two as a group.

For example, if you need to insert custom data A, look up [Appendix E](#) Character comparison table, hexadecimal is 41, then sweep 4 and 1 respectively

For example, if you need to insert the custom data ABC, check the [Appendix E](#) Character comparison table, the hexadecimal is 414243, then sweep 4, 1, 4, 2, 4, 3 respectively

- c) Scan the "OK" setup code to end setup

recognize

**1.14.3 Insertion position**

Insertion location setting can be used in two ways, method one requires user generated QR code, which tends to be more flexible to use for those who have more settings; method two can be used by scanning the setting code within this manual according to the steps.

**Method I:**

Insert position setting code content format: >!00102EXX, where XX is the setting variable, decimal range 1-65535.

For example, if the insertion position is set to 11, the setup code content is: >!00102E11.

**Method II:**

- a) Scanning the Insertion Position Setting Code

Insertion position

- b) Scan "[Digital Setting Code](#)", insert the position and scan the corresponding number setting code. For example, for the 11th position, sweep 1,1; 100th position, sweep 1,0,0.
- c) Scan the "OK" setup code to end setup

recognize

## 1.15 data replacement

This function can replace the data within the original string with any data as required.

### 1.15.1 Data Replacement Switch

\* Disable

enable

### 1.15.2 Replaced data settings

There are two ways to set up the replaced data, method 1 requires the user to generate a QR code, which tends to be more flexible for users who set up more settings; method 2 can be scanned according to the steps of the setup code in this manual.

#### Method I:

Replaced data setup code content format: >!010804XX. where XX is the setup variable, XX using hexadecimal representation, two characters as a unit, the lack of 0 to make up, can be arbitrarily superimposed, the maximum support for 20 bits.

For example: the replaced data A, check the [Appendix E](#) Character cross-reference table, hexadecimal is 41, then the set code content is: >!01080441.

For example: the replaced data ABC, check the [Appendix E](#) Character cross-reference table, hexadecimal is 414243, then set the code content is: >!010804414243.

#### Method II:

- a) Scanning the "Replaced data" setup code

Replaced data

- b) Scan the "[Digital Setting Code](#)", every two as a group.

For example: the replaced data A, check the [Appendix E](#) Character comparison table, hexadecimal is 41, then sweep 4 and 1 respectively.

For example, if the data being replaced is a new line, check [Appendix E](#) Character comparison table, hexadecimal is 0A, then sweep 0 and A, respectively.

- c) Scan the "OK" setup code to end setup

recognize

### 1.15.3 Replacement of data settings

Replacement of data settings can be used in two ways, method one requires the user to generate a QR code, which tends to be more flexible for users with more settings; method two can be used according to the steps to scan the setup code within this manual

#### Method I:

Replace the data setup code content format: >!010805XX. where XX is the setup variable, XX using hexadecimal representation, two characters as a unit, the lack of 0 to make up, can be arbitrarily superimposed, the maximum support for 20 bits.

For example: data A replaces the original data, check [Appendix E](#) character comparison table, the hexadecimal is 41, then set the code content is: >!01080541.

For example: data ABC replaces the original data, check the [Appendix E](#) Character cross-reference table, hexadecimal is 414243, then set the code content is: >!010805414243.

#### Method II:

- a) Scanning the "Replace data" setup code

Replacement data

- b) Scan the "[Digital Setting Code](#)", every two as a group.

For example: data A replaces the original data, check [Appendix E](#) Character comparison table, hexadecimal is 41, then sweep 4 and 1 respectively.

For example: data line feed replaces the original data, check [Appendix E](#) Character comparison table, hexadecimal is 0A, then sweep 0 and A respectively

- c) Scan the "OK" setup code to end setup

recognize

## 1.16 carriage return

Line feed (\n) and carriage return line feed (\r\n) are converted to carriage return (\r).

\* Disable

enable (sb. to do sth)

## 1.17 Web Site Switch

To prevent the barcode with URL information from being mistakenly scanned when scanning commodity barcodes, or some other special applications, this function can be used to prohibit the recognition of barcodes with URL information according to the demand.

\*Enable URL code

Disable site code

## 1.18 invoicing function

In order to use this module normally in the invoicing system, users can scan the following configuration code to realize the invoice code format conversion and output.

Note: This function supports Alipay QR code for invoicing and does not support WeChat QR code for invoicing.

#### 1.18.1 Invoicing function switch

\* Disable

enable

#### 1.18.2 Invoice type

\*Specialized invoices

by unanimous vote

#### 1.19 GS1 rule enable

Enable GS1 rules to enclose AI segments in parentheses.

\* Disable

enable

	All codes (hexadecimal FF) hide trailing 100-bit (hexadecimal 64) lengths	>!01080dff64.>;99
Insert Custom Data Switch	Disable	>!00102D0.>;99
	enable	>!00102D1.>;99

Customized Insert Data Example	Insert character A (hex 41)	>!01080341.>;99
	Insert the characters ABC (hexadecimal 41 42 43)	>!010803414243.>;99
Insertion Position Setting Example	Insert from after the 5th digit	>!00102E5.>;99
	Start inserting after the 20th bit of data	>!00102E20.>;99
Data replacement function switch	Disable	>!00102F0.>;99
	enable (sb. to do sth)	>!00102F1.>;99
Example of replaced data	Data 6 (hexadecimal 36) replaced	>!01080436.>;99
	Data line feeds (hex 0A) are replaced	>!0108040A.>;99
Example of Replacement Data	Replace data with A (hex 41)	>!01080541.>;99
	Replace data with BC (hexadecimal 42 43)	>!0108044243.>;99
carriage return	Disable	>!0010390.>;99
	enable	>!0010391.>;99
Web Site Switch	Scan the URL code	>!0010330.>;99
	Disable site code	>!0010331.>;99
invoicing function	Disable	>!0010340.>;99
	enable	>!0010341.>;99
Invoice type	VAT special invoice	>!0010350.>;99
	VAT general invoice	>!0010351.>;99
GS1 Rule Switch	Disable	>!0010320.>;99
	enable	>!0010321.>;99
Command Response	Disable	>!0010380.>;99
	enable	>!0010381.>;99
command tone	Disable	>!0010300.>;99
	enable	>!0010301.>;99
packet format	Disable	>!0010230.>;99
	enable	>!0010231.>;99
global switch	Disable	>!0005020.>;99
	enable	>!0005021.>;99
	default (setting)	>!0005022.>;99
1D Global Switch	Disable	>!0005000.>;99
	enable	>!0005001.>;99
	default (setting)	>!0005002.>;99
QR Code Global Switch	Disable	>!0005010.>;99
	enable	>!0005011.>;99
	default (setting)	>!0005012.>;99
Barcode Security Levels	0	>!0005080.>;99
