

XIAMEN SEALS SELECTION GUIDE BOOK

Your Static Seals & X-Rings Specialist

Xiamen Seals Technology Co.,Ltd

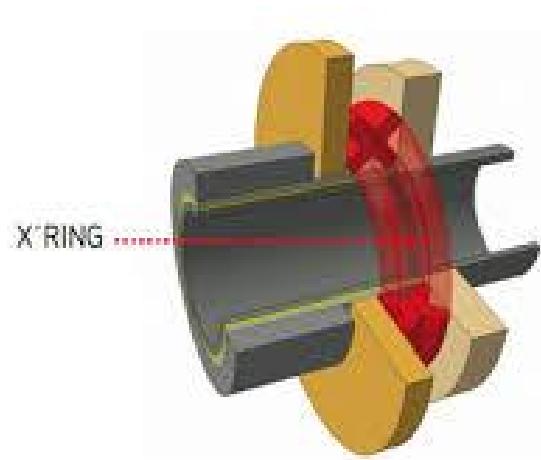

Blog

You Are In X Ring

In some applications, either type of seal will work. In others, one type will work much better. The trick is to understand the various factors that influence which type of ring seal will be the most efficient and most durable in the specific application. What distinguishes an X ring vs. O ring is actually not the shape of the overall seal. That circular shape is why it is called a ring. The X or O is for how it looks if cut into a cross section. While an O ring has a smooth, convex surface, an X ring has four grooves. That amounts to two sealing surfaces per side for the X ring vs. just one for the O ring.

Another reason to choose an X ring for a dynamic application is that their structure prevents spiral twisting. The four ends of the X shape provide a stability that an O ring cannot offer. An O ring is perfectly adequate for some low-speed pivoting, rotating or spiralling movement, but an X ring can better accommodate faster motion. An O ring might do the job for a short period, but an X ring will be more durable in applications with rapidly moving parts.

X-ring

Flash lines are on the inside
Grooves retain lubricant
Multi-lobe design has more sealing surfaces
Wide footprint

Less wear & tear means longer shelf life

X-rings have some key advantages. The inside placement of the flash (parting) lines doesn't affect the sealing lips. The larger sealing surface means it fills the corner of the application groove better, making it more resistant to rolling and preventing spiral failure — leading to greater stability in dynamic applications. The multiple seal points mean less compressive force is required to provide an effective seal. And, because the grooves retain lubricant, it reduces friction and extends seal life.
